

FOR WEB AGENCIES & MSPS

Independent web & API security testing, *behind your relationship.*

When a client asks for an independent web or API security test, you don't need to keep that capability staffed full-time. We deliver fixed-scope engagements behind your client relationship.

WHY INDEPENDENT

Whoever configures a system shouldn't be the only one testing it. We are the external, neutral check — we don't sell managed services and we don't take over your client.

FIXED SCOPE

One application or one API

Anything beyond is re-scoped in writing before work continues.

Up to 2 user roles or 50 endpoints

Scope units written into each statement of work.

Staging by default

Production only on written request, with agreed windows and a stop procedure.

YOUR RELATIONSHIP STAYS YOURS

- You keep the client relationship and the commercial lead.
- We don't solicit the clients you introduce.
- Confidentiality across the chain: you, us, your client.

HOW IT WORKS

01 Scoping

You bring the need; scope units and exclusions are agreed in writing.

02 Authorization

The end client — the system owner — signs the testing authorization naming Kemain Technologies Inc. as the tester. No test starts without it.

03 Testing

Seven-phase methodology built on OWASP, PTES and NIST SP 800-115, in staging by default.

04 Report

Executive summary and technical report with reproduction steps, for you to present to your client.

05 Retest

One retest within 30 days to confirm the fixes.

WHAT YOU RECEIVE

- Executive summary for decision-makers
- Technical report for developers, with reproduction steps
- Debrief meeting
- One retest within 30 days

A 15-minute conversation is enough to see whether it fits your overflow work.
